Data Security & Privacy Project 2 Raghu Pusapati

pusaparv@mail.uc.edu

(a) A program has been written to run each encryption modes twice and print the cipher texts. The same program has been run and output is as shown below

```
root@kali:~/Documents/aes_12499347/src# python comparison.py ../data/key.txt ../data/plaintext.txt ../data/result.txt
CBC encryption: cs_google.com/document/state/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectates/sepectat
```

The cipher texts of ECB are same both the times whereas in the case of CBC, the ciphered texts differ because the IV is generated randomly every time. Also, the length of the ciphered texts appear to be different in case of CBC and ECB but they are actually same. CBC has IV prefixed to the ciphered text. Hence the length of cipher texts are actually same. The first 16 bytes (in the output, first 32 letters because each letter is 4 bits in length) is the IV. Clearly, CBC is more secure.

So, in case of ECB, the same input always gives the same output, making it deterministic. But there are some advantages to this mode of operation. If one block get corrupted, other blocks remain intact. Meaning, there is no dependency between blocks. However, in the world of internet with TCP protocols, integrity of data is guaranteed. Also, parallel encryption and decryption of blocks is possible.

In case of CBC, the same input gives different output making it less deterministic. This mode has some disadvantages. Parallel encryption and decryption is not possible because the encryption of blocks is not independent of each other. Another disadvantage is that, an error in one block when encrypting or decrypting carries to all the subsequent blocks as well.

- (b) Two programs have been written each of which are a part of the original AES file which contain either only encryption module or decryption module. One performs only encryption and the other only decryption. They also contain timers which measure start and end time of execution. So the same codes have been run several times to calculate an average encryption and decryption times.
- I. Encryption:

```
⊲ali:~/Documents/aes<u></u>12499347/src#"python:enc"time:measure.py:d.:/data/key.txt
 ./data/plaintext-txte.co/data/ciphertext-txt of operation. If one block get corrupted, other blocks
0.000954151153564main int
       ali:~/Documents/aes_12499347/src# python_enc_time_measure.py.../data/key.txt
../data/plaintext.txt ../data/ciphertext.txt
0.00102710723877
        li:~/Documents/aes_12499347/src# python enc_time measure.py ../data/key.txt
../data/plaintext.txt<sup>o</sup>../data/ciphertext.txt
../data/plaintext.txt
../data/plaintext.txt
0.00104880332947
       lli:~/Documents/aes_12499347/src# python enc time measure.py ::/data/key.txt
../data/plaintext.txtng./data/ciphertext/txt subsequent blocks as wel
0.00134921073914
       lli:~/Documents/aes_12499347/src#.pythonrenc_time_measure.py.../data/key.txt
../data/plaintext,txt<sub>eit</sub>./data/ciphertext,txt<sub>decryption</sub> module. One performs only encryption and
0.000994920730591
 oot@kali:~/Documents/aes_12499347/src#
```

The average of all the five runs is 0.001074836 seconds.

II. Decryption:

```
i:~/Documents/aes 12499347/src# python dec time measure.py ../data/key.txt
../data/ciphertext.txt .../data/result.txt
0.000459909439087
      ali:~/Documents/aes_12499347/src# python dec time measure.py ../data/key.txt
../data/ciphertext.txt ../data/result.txt
0.000401973724365
       li:~/Documents/aes 12499347/src# python dec time measure.py ../data/key.txt
../data/ciphertext.txt ../data/result.txt
0.000417947769165
       li:~/Documents/aes_12499347/src# python dec time measure.py ../data/key.txt
../data/ciphertext.txt ../data/result.txt
0.00034499168396
       i:~/Documents/aes 12499347/src# python dec time measure.py ../data/key.txt
../data/ciphertext.txt ../data/result.txt
0.000330924987793
  ot@kali:~/Documents/aes_12499347/src#
```

The average of the five runs is 0.000391147 seconds.

The details of the OS used, language, packages and execution guides are mentioned in the readme.txt file.
